Data classification is the foundation of data security

The family of Titus Classification products provides the essential classification tools to clearly inform both your people and your policies on what information should be secured and how to handle it.

Manage and protect your data with the industry's most flexible and customizable classification metadata schema. Give your data context so people and systems understand how to handle the information.

Titus Classification products embed metadata attributes into email, documents and files at every stage of the content lifecycle and can automatically add visual markings to help organizations meet compliance and legal requirements.

Powerful data identification capabilities

The Titus family of classification products is supported by the robust Titus Data Detection engine that combines pattern matching, machine learning categorization, and automated PII detection to add context to data that protects beyond mere labelling.

Support for multiple data types and clouds

For a data protection solution to be effective, it needs to cover all the bases. Titus classification products work where you work, how you work, and in the flow of work. Titus starts by supporting the data you use every day with classification support that goes beyond emails and office documents to include PDFs, JPGs, and more. The Titus solution works with the tools your teams use every day, whether that is in a Windows environment, Mac, or even G-Suite. Lastly, whether on-premise or in the cloud, Titus supports the protection of data at rest in a wide range of file shares businesses rely on to operate 24/7.

Integrates and enhances a wide ecosystem of security tools.

Files classified with Titus gain persistent, granular, rich metadata that better informs downstream defense systems like DLPs and CASBs to reduce false positives and unlock the business value of data while integrations with leading encryption vendors take the guesswork out of rights management.

HIGHLIGHTS

The family of Titus Classification products provides the essential classification tools to clearly inform both your people and your policies on what information should be secured and how to handle it by embedding metadata attributes into email, documents, and files at every stage of the content lifecycle. Titus Classification can also automatically add visual markings to help organizations meet compliance and legal requirements.

Titus for **Data Classification**

Open, enterprise-grade policy engine

While some solutions lock customers into policy that is limited to common use cases and regulations, Titus classification capabilities are backed by the industry's most flexible policy engine and includes additional capabilities to support custom conditions and actions that allow customers to create data protection policies that are right-sized for any organization.

Titus Classification capabilities are included in a suite of tools that includes the following:

Titus Message Classification

Email continues to be the primary method for sharing information among employees, customers, and partners; presenting a challenge for organizations that must protect information assets while promoting information sharing. Titus Message Classification is a security and governance solution that ensures that email messages are classified before they are sent. Flexible classification options enable user-driven, system-suggested, or automatic application of the classification based on the recipient, sender, and content.

Titus Classification for Desktop

The disclosure of sensitive information and intellectual property in PDFs, videos, images, and design documents presents genuine challenges. With only a few clicks, users can copy sensitive files from their desktop to email, USB drives, instant messages, and other data leakage points. Titus Classification for Desktop provides the first step in protecting sensitive files from data leakage. By enabling users to assign classifications to any file, Titus Classification for Desktop identifies the value and sensitivity of information so organizations can manage, secure, and share that information.

Titus Classification for productivity suites

Available for Microsoft Office and G-Suite, Titus classification allows organizations to identify the value of their data and manage it accordingly. Titus Classification ensures documents are classified before they can be saved, printed, or sent via email. Flexible classification options enable user-driven, system-suggested, or automatic application of the classification based on the content, author, and other document attributes.

Titus Illuminate

With more people accessing and storing files in a multitude of network and cloud repositories, sensitive data could be just about anywhere. Titus Illuminate scans file storage, including on-premise file shares, Box, Dropbox, OneDrive, and Microsoft SharePoint and SharePoint Online. It examines and automatically classifies the files it discovers, ensuring appropriate data protection is applied. And, as it scans files, Illuminate gathers extensive information about each file, building a data inventory for you to run analytics to identify risk areas.
